

The Key to Cloud Security

Employees at almost every company use cloud services to store and share files. Organizations understand that these services provide significant value in aiding user productivity, but IT departments and CIOs worry about data going beyond the firewall.

SecureDoc Cloud is an application that enforces transparent file encryption on cloud folders through policy, to ensure data is protected. It offers an additional layer of security to complement full disk encryption.

No matter where the data resides in the cloud, SecureDoc Cloud ensures that files are always encrypted at the end point before they are ever moved into a cloud service, thus removing the risks of any data breaches in the cloud.

With SecureDoc Cloud, the contents of the cloud storage folder on a device are always encrypted. Synchronization of encrypted content takes place transparently, ensuring that all files remain encrypted in the cloud.

WinMagic's cloud solution spans across multiple platforms, i.e. users are able to share encrypted data between Windows, Mac, iOS, and Android users. Encrypted data can be shared transparently between users having access to the same encryption key (i.e. no passwords required), and passwords can be set to share data externally. In addition, File Viewers are available for Windows, iOS, and Android platforms to allow encrypted data to be shared with non-SecureDoc cloud users.

Encryption keys and cloud policies are managed centrally by SecureDoc Enterprise Server (SES) to provide full control to IT administrators over data security. This also provides peace of mind to C level executives since encryption keys are not controlled by third parties and the fact that IT administrators can easily recover encrypted data.
